

10600 PIXELS \times 3 COLOR CCD LINEAR IMAGE SENSOR

The μ PD3778 is a color CCD (Charge Coupled Device) linear image sensor which changes optical images to electrical signal and has the function of color separation.

The μ PD3778 has 3 rows of 10600 pixels, and each row has a double-sided readout type of charge transfer register. And it has reset feed-through level clamp circuits and voltage amplifiers. Therefore, it is suitable for 1200 dpi/A4 color image scanners and so on.

FEATURES

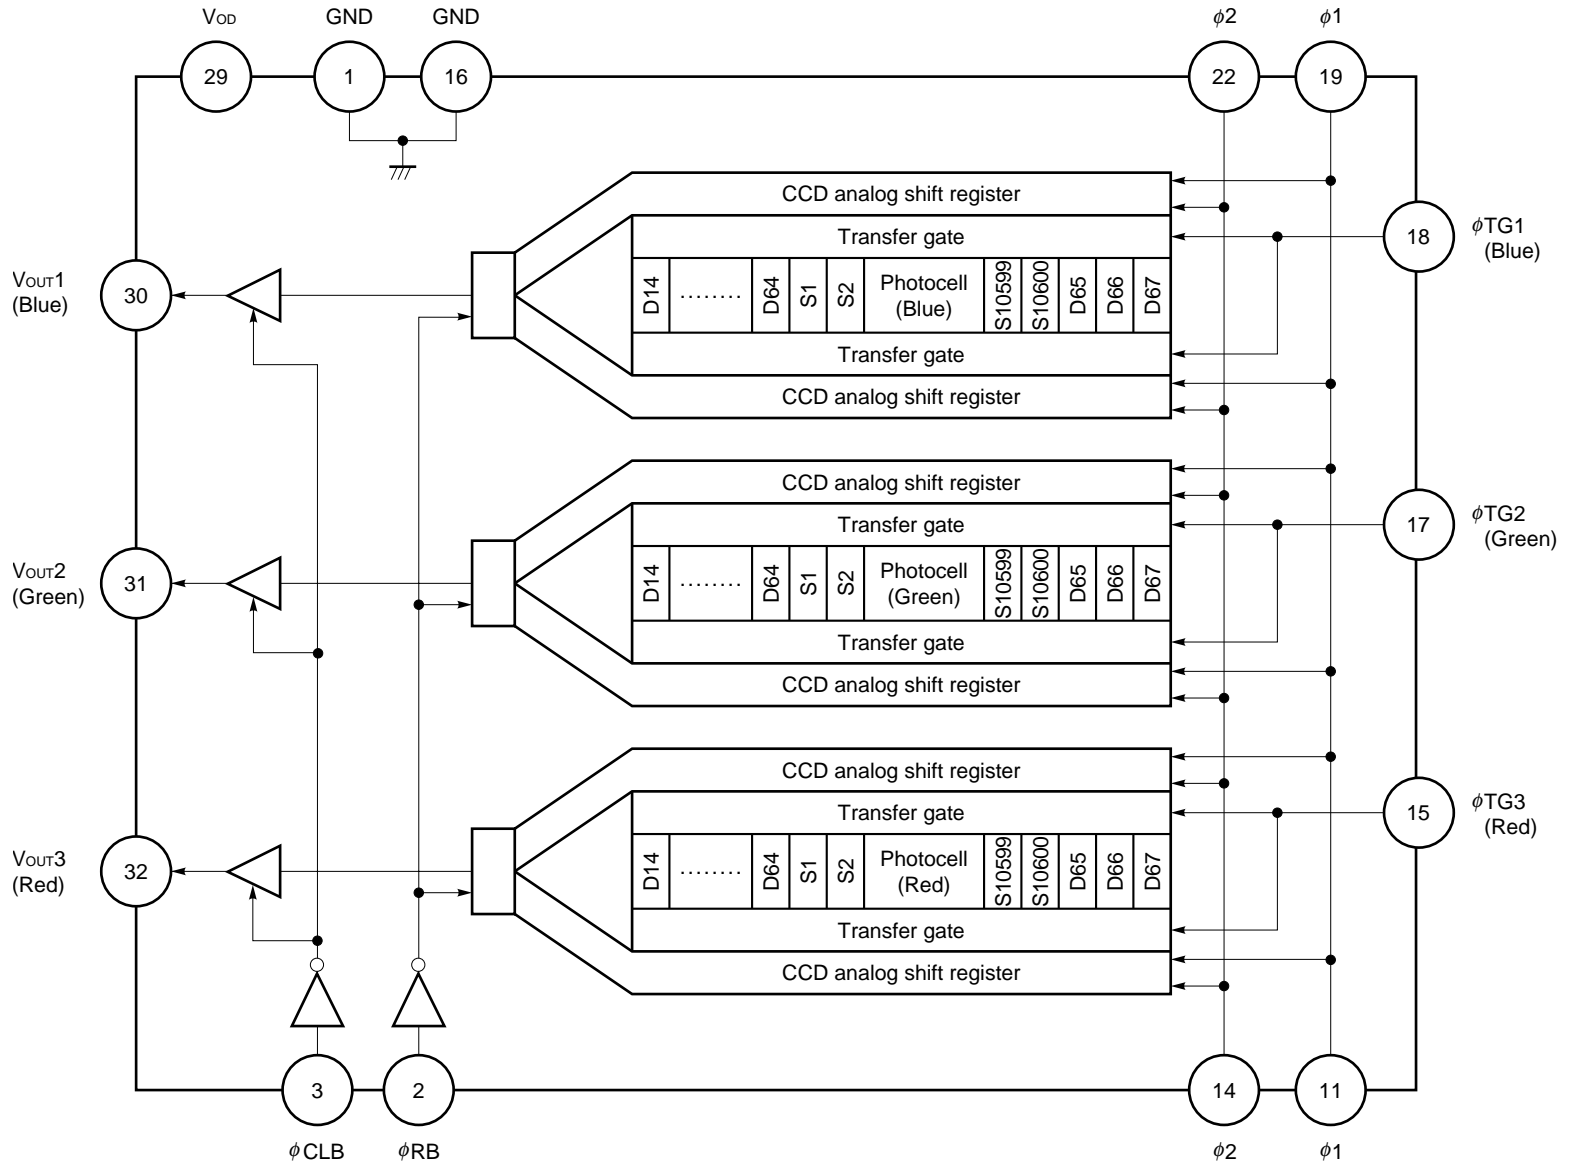

- Valid photocell : 10600 pixels \times 3
- Photocell's pitch : 4 μ m
- Photocell size : 4 \times 4 μ m²
- Line spacing : 48 μ m (12 lines) Red line-Green line, Green line-Blue line
- Color filter : Primary colors (red, green and blue), pigment filter (with light resistance 10⁷ lx•hour)
- Resolution : 48 dot/mm A4 (210 \times 297 mm) size (shorter side)
1200 dpi US letter (8.5" \times 11") size (shorter side)
- Drive clock level : CMOS output under 5 V operation
- Data rate : 5 MHz MAX.
- Power supply : +12 V
- On-chip circuits : Reset feed-through level clamp circuits
Voltage amplifiers

ORDERING INFORMATION

Part Number	Package
μ PD3778CY	CCD linear image sensor 32-pin plastic DIP (400 mil)

The information in this document is subject to change without notice. Before using this document, please confirm that this is the latest version.
Not all devices/types available in every country. Please check with local NEC representative for availability and additional information.

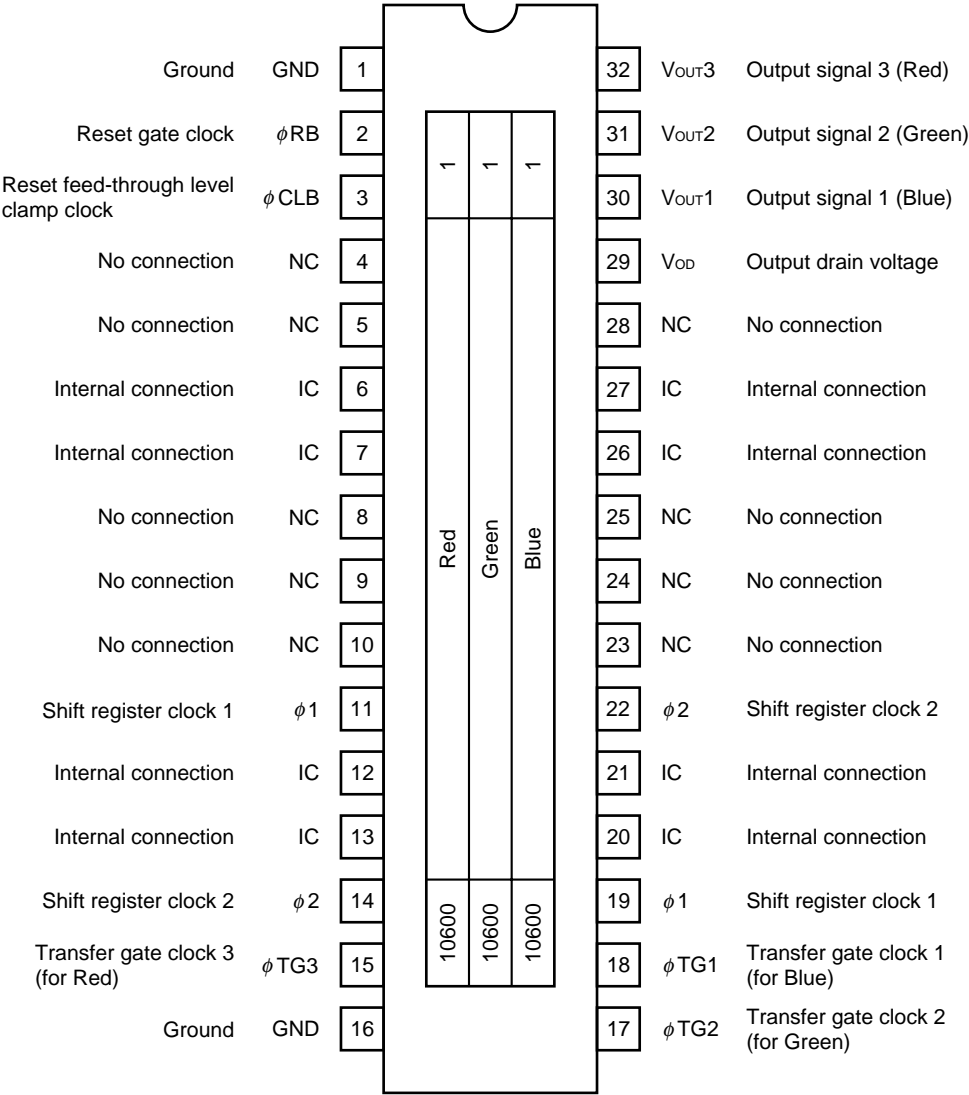

BLOCK DIAGRAM

PIN CONFIGURATION (Top View)

CCD linear image sensor 32-pin plastic DIP (400 mil)

- μPD3778CY

Caution Leave pins 6, 7, 12, 13, 20, 21, 26, 27 (IC) unconnected.

PHOTOCELL STRUCTURE DIAGRAM

PHOTOCELL ARRAY STRUCTURE DIAGRAM
(Line spacing)

ABSOLUTE MAXIMUM RATINGS ($T_A = +25\text{ }^{\circ}\text{C}$)

Parameter	Symbol	Ratings	Unit
Output drain voltage	V_{OD}	-0.3 to +15	V
Shift register clock voltage	$V_{\phi1}, V_{\phi2}$	-0.3 to +8	V
Reset gate clock voltage	$V_{\phi RB}$	-0.3 to +8	V
Reset feed-through level clamp clock voltage	$V_{\phi CLB}$	-0.3 to +8	V
Transfer gate clock voltage	$V_{\phi TG1}$ to $V_{\phi TG3}$	-0.3 to +8	V
Operating ambient temperature	T_A	-25 to +60	$^{\circ}\text{C}$
Storage temperature	T_{stg}	-40 to +70	$^{\circ}\text{C}$

Caution Exposure to **ABSOLUTE MAXIMUM RATINGS** for extended periods may affect device reliability; exceeding the ratings could cause permanent damage. The parameters apply independently.

RECOMMENDED OPERATING CONDITIONS ($T_A = +25\text{ }^{\circ}\text{C}$)

Parameter	Symbol	MIN.	TYP.	MAX.	Unit
Output drain voltage	V_{OD}	11.4	12.0	12.6	V
Shift register clock high level	$V_{\phi1H}, V_{\phi2H}$	4.5	5.0	5.5	V
Shift register clock low level	$V_{\phi1L}, V_{\phi2L}$	-0.3	0	+0.5	V
Reset gate clock high level	$V_{\phi RBH}$	4.5	5.0	5.5	V
Reset gate clock low level	$V_{\phi RBL}$	-0.3	0	+0.5	V
Reset feed-through level clamp clock high level	$V_{\phi CLBH}$	4.5	5.0	5.5	V
Reset feed-through level clamp clock low level	$V_{\phi CLBL}$	-0.3	0	+0.5	V
Transfer gate clock high level	$V_{\phi TG1H}$ to $V_{\phi TG3H}$	4.5	$V_{\phi1H}$ ^{Note}	$V_{\phi1H}$ ^{Note}	V
Transfer gate clock low level	$V_{\phi TG1L}$ to $V_{\phi TG3L}$	-0.3	0	+0.5	V
Data rate	$f_{\phi RB}$	—	1.0	5.0	MHz

Note When Transfer gate clock high level ($V_{\phi TG1H}$ to $V_{\phi TG3H}$) is higher than Shift register clock high level ($V_{\phi1H}$), Image lag can increase.

ELECTRICAL CHARACTERISTICS

($T_A = +25\text{ }^{\circ}\text{C}$, $V_{OD} = 12\text{ V}$, data rate ($f_{\phi RB}$) = 2 MHz, storage time = 5.5 ms, input signal clock = 5 V_{p-p} ,
light source: 3200 K halogen lamp +C-500S (infrared cut filter, $t = 1\text{ mm}$) + HA-50 (heat absorbing filter, $t = 3\text{ mm}$))

Parameter		Symbol	Test Conditions	MIN.	TYP.	MAX.	Unit
Saturation voltage		V_{sat}		2.0	2.5	—	V
Saturation exposure	Red	SER			0.694		$\text{lx}\cdot\text{s}$
	Green	SEG			0.757		$\text{lx}\cdot\text{s}$
	Blue	SEB			1.250		$\text{lx}\cdot\text{s}$
Photo response non-uniformity		PRNU	$V_{OUT} = 1.0\text{ V}$		6	20	%
Average dark signal		ADS	Light shielding		0.2	4.0	mV
Dark signal non-uniformity		DSNU	Light shielding		1.5	4.0	mV
Power consumption		P_W			400	600	mW
Output impedance		Z_O			0.5	1	$k\Omega$
Response	Red	R_R		2.52	3.60	4.68	$\text{V}/\text{lx}\cdot\text{s}$
	Green	R_G		2.31	3.30	4.29	$\text{V}/\text{lx}\cdot\text{s}$
	Blue	R_B		1.40	2.00	2.60	$\text{V}/\text{lx}\cdot\text{s}$
Image lag		IL	$V_{OUT} = 1.0\text{ V}$		2.0	10.0	%
Offset level Note1		V_{OS}		4.0	6.0	7.0	V
Output fall delay time Note2		t_d	$V_{OUT} = 1.0\text{ V}$		50		ns
Total transfer efficiency		TTE	$V_{OUT} = 1.0\text{ V}$, data rate = 5 MHz	92	98		%
Register imbalance		RI	$V_{OUT} = 1.0\text{ V}$	0	1.0	4.0	%
Response peak	Red				630		nm
	Green				540		nm
	Blue				460		nm
Dynamic range	DR1	V_{sat}/DSNU			1666		times
	DR2	$V_{sat}/\sigma\text{ CDS}$			2500		times
Reset feed-through noise Note1		RFTN	Light shielding	−1000	−300	+500	mV
Random noise (CDS)		$\sigma\text{ CDS}$	Light shielding	—	1.0	—	mV

Notes 1. Refer to **TIMING CHART 2**.

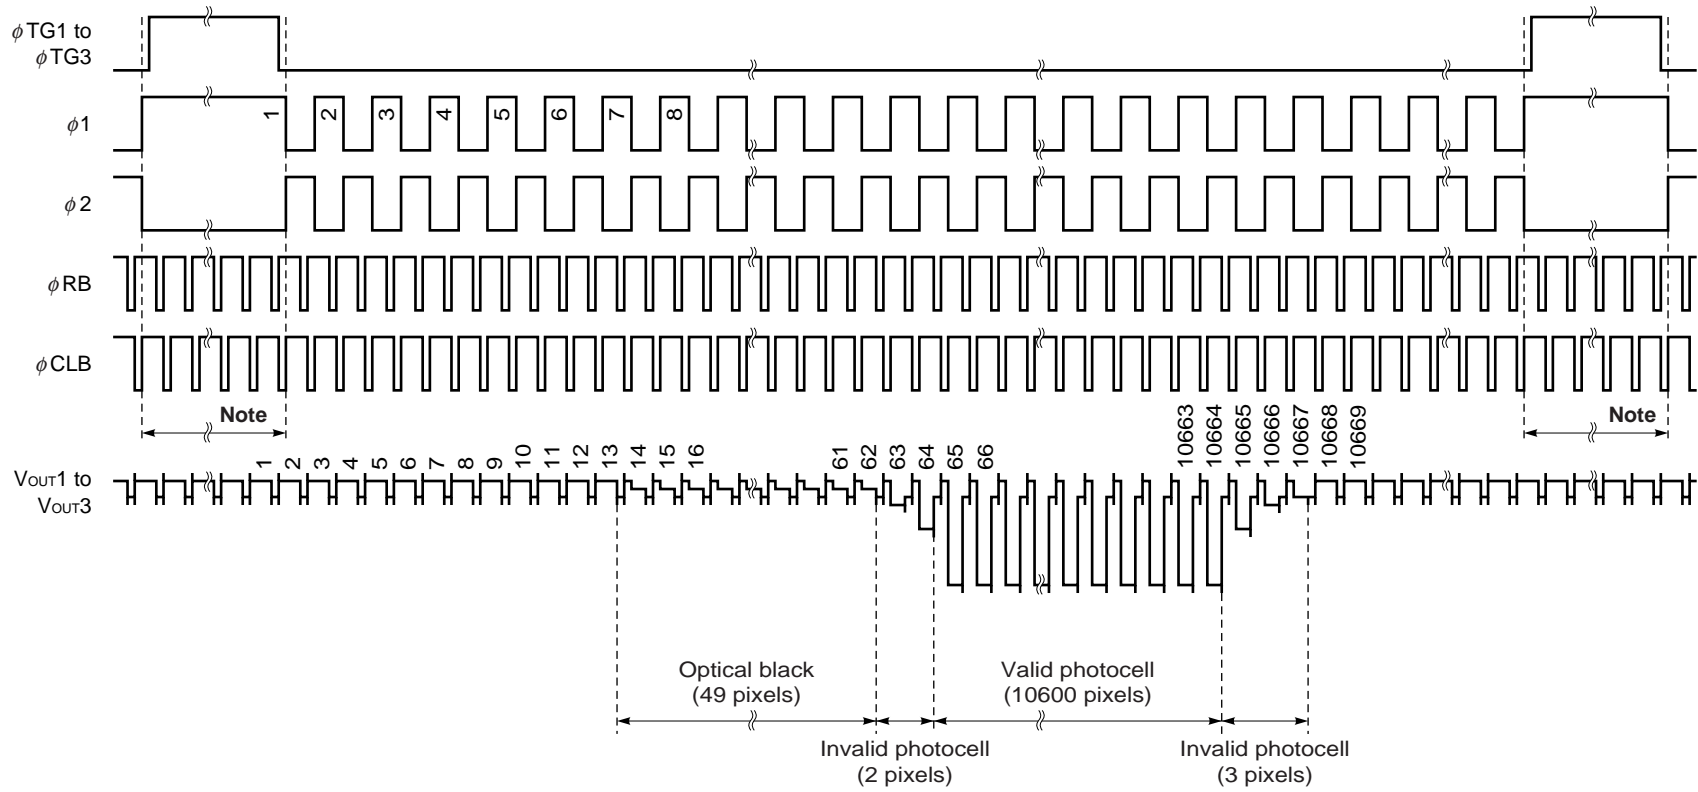

2. When each fall time of ϕ_1 and ϕ_2 (t_2 , t_1) is the TYP. value (refer to **TIMING CHART 2**).

INPUT PIN CAPACITANCE (T_A = +25 °C, V_{OD} = 12 V)

Parameter	Symbol	Pin name	Pin No.	MIN.	TYP.	MAX.	Unit
Shift register clock pin capacitance 1	C _{φ1}	φ1	11		400		pF
			19		400		pF
Shift register clock pin capacitance 2	C _{φ2}	φ2	14		400		pF
			22		400		pF
Reset gate clock pin capacitance	C _{φRB}	φRB	2		15		pF
Reset feed-through level clamp clock pin capacitance	C _{φCLB}	φCLB	3		15		pF
Transfer gate clock pin capacitance	C _{φTG}	φTG1	18		120		pF
		φTG2	17		120		pF
		φTG3	15		120		pF

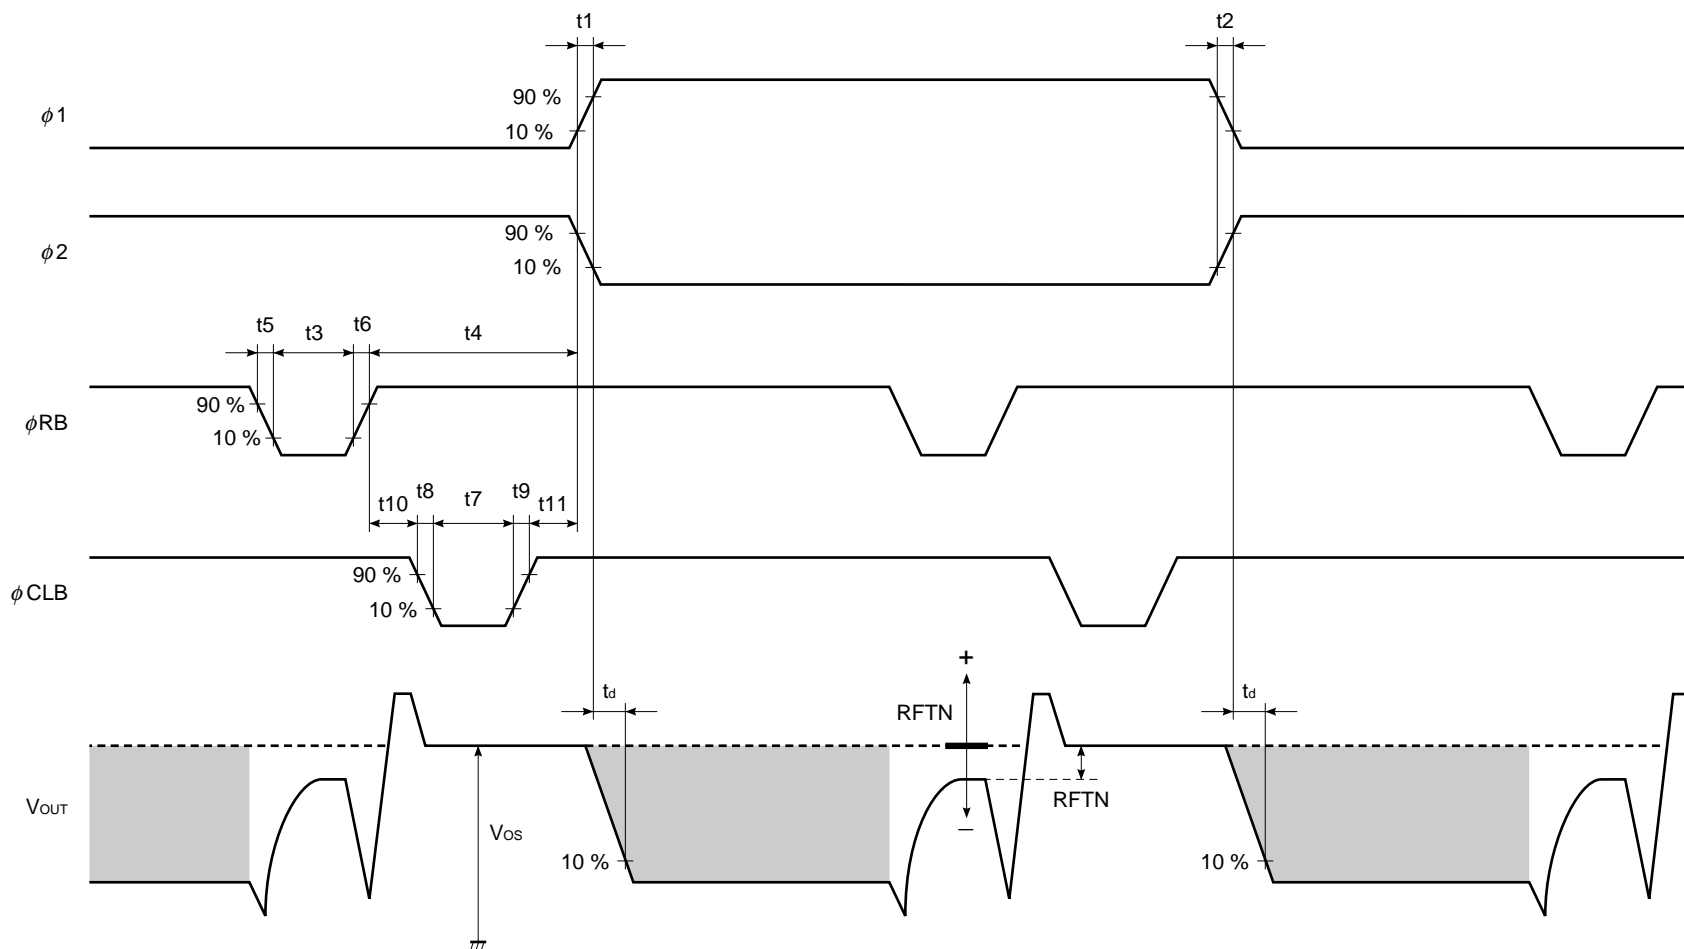

Remark Pins 11 and 19 (φ1), 14 and 22 (φ2) are each connected inside of the device.

TIMING CHART 1 (for each color)

Note Input the ϕ RB and ϕ CLB pulses continuously during this period, too.

TIMING CHART 2 (for each color)

φTG1 to φTG3, φ1, φ2 TIMING CHART

Symbol	MIN.	TYP.	MAX.	Unit
t1, t2	0	25	—	ns
t3	20	50	—	ns
t4	70	250	—	ns
t5, t6	0	25	—	ns
t7	30	50	—	ns
t8, t9	0	25	—	ns
t10	30	50	—	ns
t11	5	15	—	ns
t12	5000	10000	—	ns
t13, t14	0	50	—	ns
t15, t16	900	1000	—	ns

φ1, φ2 cross points

Remark Adjust cross points of ϕ 1 and ϕ 2 with input resistance of each pin.

DEFINITIONS OF CHARACTERISTIC ITEMS

1. Saturation voltage: V_{sat}
Output signal voltage at which the response linearity is lost.
2. Saturation exposure: SE
Product of intensity of illumination (I_x) and storage time (s) when saturation of output voltage occurs.
3. Photo response non-uniformity: PRNU
The output signal non-uniformity of all the valid pixels when the photosensitive surface is applied with the light of uniform illumination. This is calculated by the following formula.

$$\text{PRNU (\%)} = \frac{\Delta x}{\bar{x}} \times 100$$

Δx : maximum of $|x_j - \bar{x}|$

$$\bar{x} = \frac{\sum_{j=1}^{10600} x_j}{10600}$$

x_j : Output voltage of valid pixel number j

4. Average dark signal: ADS
Average output signal voltage of all the valid pixels at light shielding. This is calculated by the following formula.

$$\text{ADS (mV)} = \frac{\sum_{j=1}^{10600} d_j}{10600}$$

d_j : Dark signal of valid pixel number j

5. Dark signal non-uniformity: DSNU
Absolute maximum of the difference between ADS and voltage of the highest or lowest output pixel of all the valid pixels at light shielding. This is calculated by the following formula.

$\text{DSNU (mV)} : \text{maximum of } |d_j - \text{ADS}|_{j=1 \text{ to } 10600}$

d_j : Dark signal of valid pixel number j

6. Output impedance: Z_o
Impedance of the output pins viewed from outside.
7. Response: R
Output voltage divided by exposure ($I \times s$).
Note that the response varies with a light source (spectral characteristic).

8. Image Lag: IL
The rate between the last output voltage and the next one after read out the data of a line.

9. Register imbalance: RI
The rate of the difference between the averages of the output voltage of Odd and Even pixels, against the average output voltage of all the valid pixels.

$$RI (\%) = \frac{\frac{2}{n} \left| \sum_{j=1}^{\frac{n}{2}} (V_{2j-1} - V_{2j}) \right|}{\frac{1}{n} \sum_{j=1}^n V_j} \times 100$$

n : Number of valid pixels
 V_j : Output voltage of each pixel

10. Random noise (CDS): σ_{CDS}

Random noise (CDS) σ_{CDS} is defined as the standard deviation of a valid pixel output signal with 100 times (= 100 lines) data sampling at dark (light shielding). This is measured by the following procedure.

1. One valid photocell in one reading is fixed as measurement point.
2. The output level is measured during the Reset feed-through period which is averaged over 100 ns to get “ VD_i ”.
3. The output level is measured during the Video output time averaged over 100 ns to get “ VO_i ”.
4. The correlated double sampling output is defined by “ $VCDS_i = VD_i - VO_i$ ”.
5. Repeat the above procedure (1 to 4) for 100 times (= 100 lines).
6. Calculate the standard deviation σ_{CDS} using the following formula.

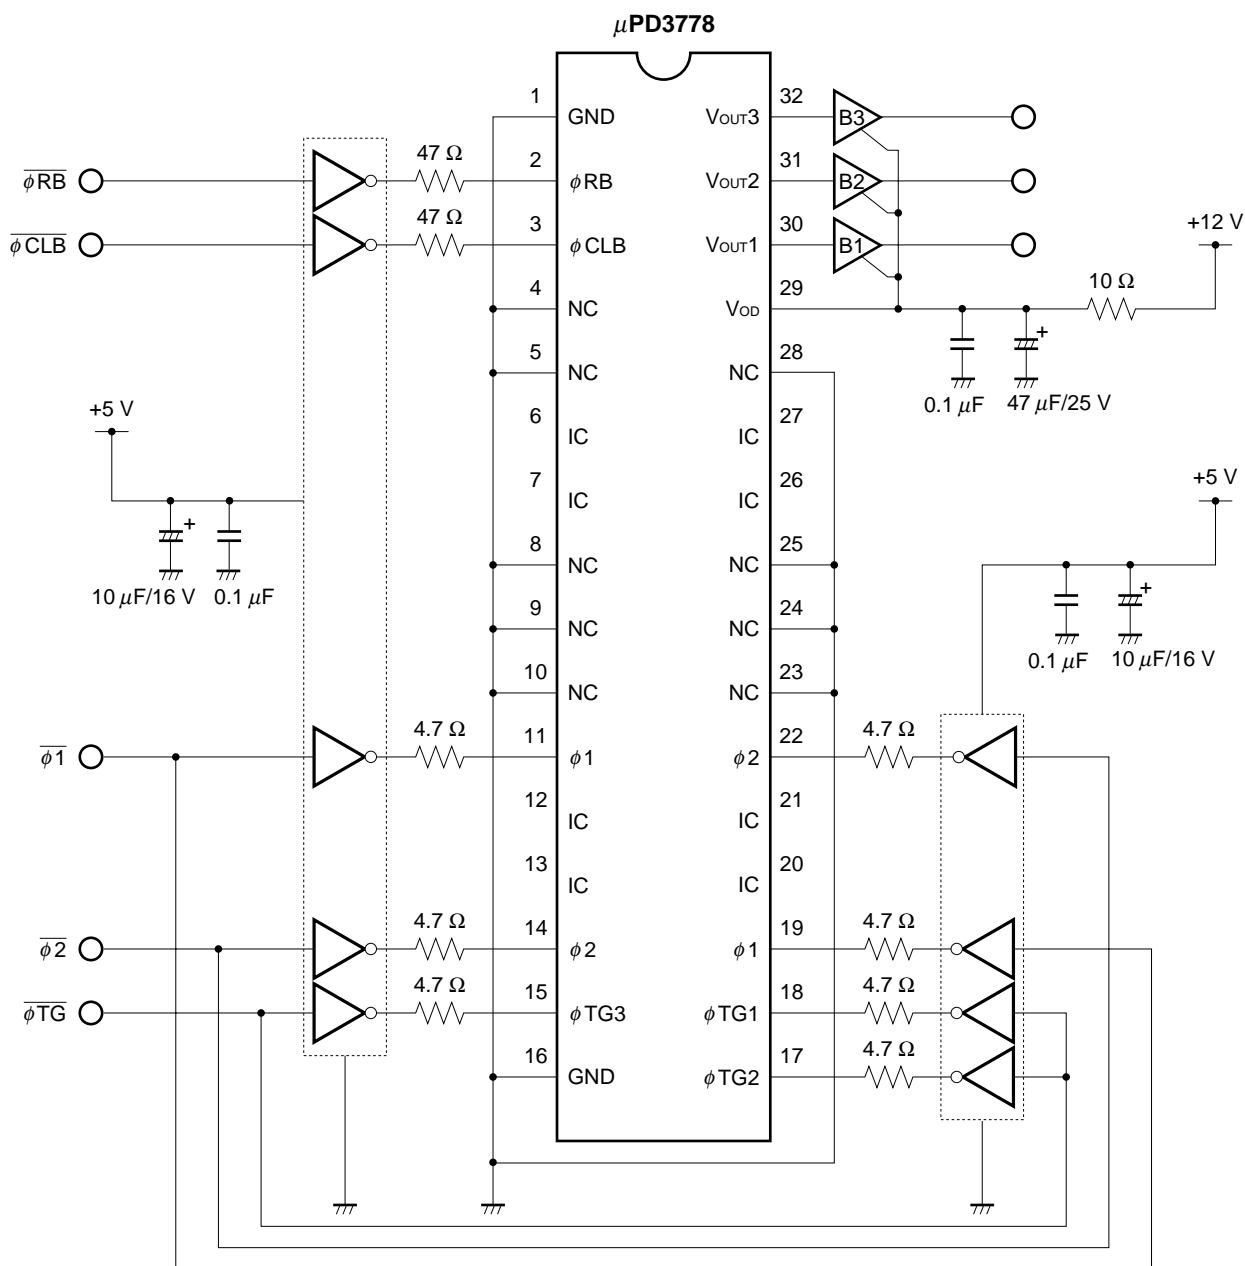

$$\sigma_{CDS} \text{ (mV)} = \sqrt{\frac{\sum_{i=1}^{100} (VCDS_i - \bar{V})^2}{100}}, \quad \bar{V} = \frac{1}{100} \sum_{i=1}^{100} VCDS_i$$

STANDARD CHARACTERISTIC CURVES (Nominal)

APPLICATION CIRCUIT EXAMPLE

Caution Leave pins 6, 7, 12, 13, 20, 21, 26, 27 (IC) unconnected.

Remark The inverters shown in the above application circuit example are the 74HC04 or 74AC04.

PACKAGE DRAWING

CCD LINEAR IMAGE SENSOR 32-PIN PLASTIC DIP (400 mil)

(Unit : mm)

Name	Dimensions	Refractive index
Plastic cap	$52.2 \times 6.4 \times 0.7^{*4}$	1.5

※ 1 The 1st valid pixel ←→ The center of the pin1

※ 2 The surface of the chip ←→ The top of the cap

※ 3 The bottom of the package ←→ The surface of the chip

※ 4 Thickness of plastic cap over CCD chip

32C-1CCD-PKG3

RECOMMENDED SOLDERING CONDITIONS

When soldering this product, it is highly recommended to observe the conditions as shown below.

If other soldering processes are used, or if the soldering is performed under different conditions, please make sure to consult with our sales offices.

For more details, refer to our document "**Semiconductor Device Mounting Technology Manual**"(C10535E).

Type of Through-hole Device

μ PD3778CY : CCD linear image sensor 32-pin plastic DIP (400 mil)

Process	Conditions
Partial heating method	Pin temperature: 300 °C or below, Heat time: 3 seconds or less (per pin)

Caution During assembly care should be taken to prevent solder or flux from contacting the plastic cap.
The optical characteristics could be degraded by such contact.

NOTES ON CLEANING THE PLASTIC CAP

① CLEANING THE PLASTIC CAP

Care should be taken when cleaning the surface to prevent scratches.

The optical characteristics of the CCD will be degraded if the cap is scratched during cleaning.

We recommend cleaning the cap with a soft cloth moistened with one of the recommended solvents below. Excessive pressure should not be applied to the cap during cleaning. If the cap requires multiple cleanings it is recommended that a clean surface or cloth be used.

② RECOMMENDED SOLVENTS

The following are the recommended solvents for cleaning the CCD plastic cap. Use of solvents other than these could result in optical or physical degradation in the plastic cap. Please consult your sales office when considering an alternative solvent.

Solvents	Symbol
Ethyl Alcohol	EtOH
Methyl Alcohol	MeOH
Isopropyl Alcohol	IPA
N-methyl Pyrrolidone	NMP

NOTES FOR CMOS DEVICES**① PRECAUTION AGAINST ESD FOR SEMICONDUCTORS**

Note:

Strong electric field, when exposed to a MOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it once, when it has occurred. Environmental control must be adequate. When it is dry, humidifier should be used. It is recommended to avoid using insulators that easily build static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work bench and floor should be grounded. The operator should be grounded using wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with semiconductor devices on it.

② HANDLING OF UNUSED INPUT PINS FOR CMOS

Note:

No connection for CMOS device inputs can be cause of malfunction. If no connection is provided to the input pins, it is possible that an internal input level may be generated due to noise, etc., hence causing malfunction. CMOS devices behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using a pull-up or pull-down circuitry. Each unused pin should be connected to V_{DD} or GND with a resistor, if it is considered to have a possibility of being an output pin. All handling related to the unused pins must be judged device by device and related specifications governing the devices.

③ STATUS BEFORE INITIALIZATION OF MOS DEVICES

Note:

Power-on does not necessarily define initial status of MOS device. Production process of MOS does not define the initial operation status of the device. Immediately after the power source is turned ON, the devices with reset function have not yet been initialized. Hence, power-on does not guarantee out-pin levels, I/O settings or contents of registers. Device is not initialized until the reset signal is received. Reset operation must be executed immediately after power-on for devices having reset function.

• **The information in this document is current as of July, 1999. The information is subject to change without notice. For actual design-in, refer to the latest publications of NEC's data sheets or data books, etc., for the most up-to-date specifications of NEC semiconductor products. Not all products and/or types are available in every country. Please check with an NEC sales representative for availability and additional information.**

- No part of this document may be copied or reproduced in any form or by any means without prior written consent of NEC. NEC assumes no responsibility for any errors that may appear in this document.
- NEC does not assume any liability for infringement of patents, copyrights or other intellectual property rights of third parties by or arising from the use of NEC semiconductor products listed in this document or any other liability arising from the use of such products. No license, express, implied or otherwise, is granted under any patents, copyrights or other intellectual property rights of NEC or others.
- Descriptions of circuits, software and other related information in this document are provided for illustrative purposes in semiconductor product operation and application examples. The incorporation of these circuits, software and information in the design of customer's equipment shall be done under the full responsibility of customer. NEC assumes no responsibility for any losses incurred by customers or third parties arising from the use of these circuits, software and information.
- While NEC endeavours to enhance the quality, reliability and safety of NEC semiconductor products, customers agree and acknowledge that the possibility of defects thereof cannot be eliminated entirely. To minimize risks of damage to property or injury (including death) to persons arising from defects in NEC semiconductor products, customers must incorporate sufficient safety measures in their design, such as redundancy, fire-containment, and anti-failure features.
- NEC semiconductor products are classified into the following three quality grades:

"Standard", "Special" and "Specific". The "Specific" quality grade applies only to semiconductor products developed based on a customer-designated "quality assurance program" for a specific application. The recommended applications of a semiconductor product depend on its quality grade, as indicated below. Customers must check the quality grade of each semiconductor product before using it in a particular application.

"Standard": Computers, office equipment, communications equipment, test and measurement equipment, audio and visual equipment, home electronic appliances, machine tools, personal electronic equipment and industrial robots

"Special": Transportation equipment (automobiles, trains, ships, etc.), traffic control systems, anti-disaster systems, anti-crime systems, safety equipment and medical equipment (not specifically designed for life support)

"Specific": Aircraft, aerospace equipment, submersible repeaters, nuclear reactor control systems, life support systems and medical equipment for life support, etc.

The quality grade of NEC semiconductor products is "Standard" unless otherwise expressly specified in NEC's data sheets or data books, etc. If customers wish to use NEC semiconductor products in applications not intended by NEC, they must contact an NEC sales representative in advance to determine NEC's willingness to support a given application.

(Note)

- (1) "NEC" as used in this statement means NEC Corporation and also includes its majority-owned subsidiaries.
- (2) "NEC semiconductor products" means any semiconductor product developed or manufactured by or for NEC (as defined above).
